

Hudson anomalies

General information

Test type: FCA

Created on: 2022-09-08

TestKey: 1

Organisation: B2BABE21-1705-4750-AE99-8D1316755876

Language: en-INT

Anomaly Score: 0.25

Test Anomaly Detection

- This test isn't considered an anomaly, but has at least one detection algorithm that detected this test as an anomaly.

DBscan (True)

DBSCAN is an unsupervised clustering algorithm. From a complete dataset, core instances are searched, which are instances that lie within a certain euclidean distance (epsilon=2) from defined number of other instances (min_samples=50). Clusters are then formed by grouping all instances that lie within that distance from at least one of these core instances. A collection of core instances can fall within the same cluster. All instances that do not lie within the distance epsilon of a core instance are considered anomalous

DBscan did detect this anomaly, meaning it clustered in any nearby group.
